

## Tire Care for Cleaner Air

- Measure your tire pressure when the tires are “cold.” Cold means that the tires have been stationary for at least three hours.
- Underinflation increases tire wear, reduces fuel economy by up to 3%, and leads to higher releases of air pollutants.
- Check your tire pressure regularly. Use a tire pressure gauge once a month and keep your tires properly inflated.
- The recommended tire pressure can be found on the vehicle’s tire information placard or in your owner’s manual.
